

BY INSTALLING ENVIRONMENTALLY FRIENDLY TAPS IN YOUR KITCHEN AND BATHROOM, YOU CAN REDUCE YOUR ENERGY CONSUMPTION BY UP TO 30%.

Some time ago, we decided to work increasingly to promote a healthier, more sustainable environment. Among other things, we're increasing our efforts to combat small everyday environmental problems, which we know affect us just as much as the bigger problems.

The idea behind ECOSAFE is to always focus on the whole picture. We need to reduce our products' environment impact without compromising other aspects of our products. For this reason, we must start by minimising the total environmental impact of our activities and production. After this, we will minimise the total impact for you, as a user.

We have gathered together all the company's experience, expertise and commitment to solve these issues. Together, we have reviewed all aspects of our products – from energy and water particle technology in our mixers to transport and energy consumption at the factory.

Like many scientists and other experts, we believe that people have an increasing impact on our planet. We will do everything we can to bring about positive changes. You can do the same.

CERAMIC SEAL

Stops taps from dripping, saving vast quantities of water.

ECOFLOW

Automatically reduces consumption of hot and cold water by limiting the maximum flow. You'll hardly notice the difference, but you'll save thousands of litres of water.

COLD START (optional)

When you turn on the tap with the lever facing straight forwards, it only supplies cold water – not a mixture of hot and cold as with traditional taps. This means that you save hot water without compromising on comfort.

SOFT CLOSING

The soft closing function slightly delays the closure of the tap. This prevents pressure shocks and impact in the pipes, increasing the life of both taps and pipes in the long term.

RECYCLING

All products are fully recyclable, thanks to the use of less brass and more environmentally friendly polymer.

CLEANING

We always use water to wash the oil from all parts. This oil is recycled in a closed cleaning system.

WEIGHT

By choosing new materials and reducing the amount of material, we've made our new ECOSAFE-labelled taps lighter. This reduces energy consumption and emissions from transportation and warehouse handling.

WASTE SEPARATION

Our packagings are specially designed to facilitate waste separation for recycling. We also recycle metal, plastic and paper internally.

RESOURCE MANAGEMENT

We minimise the amount of energy used for production and transport. We also reduce our use of energy-intensive materials. We focus on energy efficiency in the manufacturing phase when producing our most energy-intensive goods.

PRODUCTION

Fewer production stages result in lower energy consumption. This means less spillage and shavings, in turn reducing the amount of transport required.

ENVIRONMENTAL CERTIFICATION

We currently apply an environmental management system according to ISO 14001.
